

These files replicated the analysis in “Do job fairs matter? Experimental evidence on the impact of job-fair attendance”

Emily Beam, NUS

Data files:

Raw data files are located in the “Data” folder

`bulandata_public.dta`: Raw baseline and survey data file

`LFS_cleaned_region05.dta`: January 2011 Labor Force Survey Data for Appendix Table A.4

Do files:

All do-files to replicate analysis are in the “Do-files” folder.

`0_1_Replication_JobFair_JDE.do` serves as the master do-file, setting up the path locations and then running the appropriate files.

Steps to replicate analysis:

1. Open `0_1_Replication_JobFair_JDE.do` and modify the path names to reflect the locations of your data, do-files, and output folders.
2. To construct the data file used for analysis, `bulan_public_var`, run the Part 1 do-files: `calc_experience.do` and `1rep_variables.do`
3. To set up the regression specifications, run Part 2, including `specification_setup.do` and the definitions of the appropriate covariates
4. To replicate the tables, run Part 3 and Part 4. The data files and sample are determined by running `specification`, which was set up by `specification_setup.do` (Part 2).
